Warnings when using Susol MCCB for PV applications

The following warning must be kept when using Susol MCCB for PV applications
When violated, it can cause serious damages on relevant products or incur injuries.

Warning

1. Please use wiring in accordance with the diagrams shown below.

Otherwise, usable voltage may be different from the stated requirement.

DC500V (2P)

DC750V (3P)

DC1000V (4P)

2. Wire length should be at least 60cm. Shorter wires can cause increase in temperature.
3. De-rated use is highly recommended when designing circuit by using busbar in a manner shown in Figure 1 on the right. If not, it can cause increase in temperature, erroneous trip, damage or fire due to the shortage of heat release(Please refer to the De-rating Table.)
4. Please use thickness and length of busbar in compliance with the specification drawing. When used differently, additional de-rating may be required to release the heat.
5. Use of tin-plated busbar is recommended.
6. Inside of the low voltage panel should not exceed 40°C specified in KS/IEC Standard. Install sun screens or ventilation system if necessary. If violated, it can cause increase in temperature, erroneous trip, damage or fire. Also, additional de-rating is required when the temperature exceeds 40°C.
7. If you have additional questions regarding the application method, please consult with us before the use.

Memo

VCB

Vacuum Circuit Breakers

Vacuum Circuit Breaker, VCB is installed in the medium voltage distribution lines to protect life and load equipment. In case of accidents such as over current, short circuit and ground fault current, VCB works by interrupting the circuit through the inner Vacuum Interrupter which is acted by signal from the outside separate relay.

Suitable for use as the main circuit breaker to protect key installations in the places such as device industry, power plants, high-rise buildings, large ships.

- ▶ **Strengthening of the high interrupting capacity and large current models and full line-up new VCB models to high/middle/low.**
- ▶ **Main circuit structure with high reliability.**

Cast Resin Transformer

Standard components

1st terminal

This is connected to the inlet cable, so check the bolt tightening condition before inputting power.

2nd terminal

This is connected to the flexible bus and cable in the 2nd load side, so check the bolt tightening condition before inputting power.

Grounding terminal

This is attached on the bottom frame, so check the grounding condition before inputting power.

Tap change terminal

To change the 2nd voltage of the transformer, turn off the tap and adjust the tap terminal.

Danger mark

Touching the coil surface during operation of the transformer can cause danger, so never touch it during operation

Lifting eye

This is attached on the top of the top frame, so use it to lift the transformer.

Cushion rubber

Insert cushion rubber between the transformer bed frame and the ground to prevent iron core vibrations from transferring to the floor during operation to reduce noises.

Tap change terminal cover Insulate

The conductor part of the tap terminals to secure an insulation distance and improve safety.

Installation and operation conditions

Pre-checking and maintenance are essential to increase the lifespan and efficiency of the product. Maintaining by all means because the maintenance of cast resin transformers is simple compared to other kinds.

Checkpoints when installing cast resin transformers

- **Installation condition**

- The installation place shall be clean, have no worry of flooding, and have no danger of water falling from the ceiling.
- The installation place shall have a ventilation structure to ventilate the heat generated from the transformer enough.

- **Checking of cast resin transformers that are in a long-term storage condition**

- If dust is accumulated after long-term storage of cast resin trans-formers, then remove dust using a vacuum cleaner or blow out dust using a compressor and wipe out dust using a dry cloth.

- **The vinyl packing for prevention of foreign substances such as dust, screws, nuts and washers from invading shall be maintained until power is inputted after installation.**

- **Torque management when connecting the low voltage terminal**

Bolt	M8	M10	M12	M16
Torque	125	250	405	1500

Unit: kgf.cm

Caution when connecting the terminals

When connecting cables or busbars to the 1st, 2nd terminals, avoid mechanical stresses to the 1st, 2nd terminals, and especially when connecting busbars, use flexible busbars by all means to reduce mechanical stresses due to transformer vibrations. Connecting busbars directly to the 1st, 2nd terminals can loosen the connection parts or cause abnormal noises due to transformer vibrations during operation.

How to minimize transformer noises when installing transformers

- Install cushion rubber beneath the bed frame.
- When installing transformers, separate them mechanically from their enclosures to prevent vibrations of the enclosures.
- When connecting terminals, use flexible busbars.
- The transformer installation places shall be rigid and maintain horizons well.
- Large-capacity transformers shall be installed near pillars of the building to reduce vibrations.
- Avoid corners of the wall for installation.
- Install non-flammable sound-absorbing materials inside the panels if necessary.

Cast Resin Transformer

Considerations for ventilation

Vent height and vent area

- In the case of natural cooling, ventilation of the enclosure shall discharge the heat generated from total heat loss of the transformer enough via natural convection.
- Proper ventilation is realized by the inflow of cold air from the inlet A and the outflow of hot air through the outlet A' located at a height H.

Forced ventilation

- When the average ambient temperature is higher than 20°C or the transformer is operated often in an overload condition, forced ventilation using fans is necessary if the vent area is less than the standard.

$$A = \frac{HL}{0.1 \sqrt{H \Delta \theta a^3}} \quad (m^2)$$

$$A' > A \times 110\%(\text{min.})$$

A : Required inlet area (m²)

A' : Required outlet area (m²)

$\Delta \theta a$: Air temperature rise (K) = 15K (Approximate value)

HL : Heat loss (kW)

H : Distance from the center of the outlet and the center of the TR (m)

Minimum isolation distance

- Epoxy resin surface - Ground
- Insulation-reinforced inter-phase lead surface – Insulation cable

Voltage	Withstand voltage (kV)	Impulse voltage (kV)	Isolation distance (mm)
1.1kV or less	3	-	10
6.6kV or less	20	60	50
15kV or less	38	75	70
22.9kV or less	50	95	100
		125	150

Checkpoints before receiving power

- Remove the packing vinyl cover and check the wiring condition, isolation distance, foreign substance residuals, component breakage, bolt torque, etc.
- Check if the wiring was realized according to the nameplate.
- Measure the insulation resistance using a DC1000V insulation tester(Megger).

Maintenance / Repair

General use environment

Remove dust using a vacuum cleaner and blow out the overaccumulated dust using a dry compressor every year. the cleaning period can differ depending on the use environment. during maintenance work, check the bolt mounting conditions using a torque wrench.

A/S requesting method

If transformer-related A/S is necessary, tell the serial number on the nameplate of the cast resin transformer and the phenomenon exactly for quick and exact A/S.
